第四章 线程

1. Which of the following components of program state are shared across threads in a multithreaded process?

a. Register values

b. Heap memory

c. Global variables

d. Stack memory

bc.

2. Discuss the difference between user-level thread and kernel level thread.

User-level thread:

① Managed by user-level thread library.

② The kernel only sees the process, not the threads.

③ If one thread makes a blocking system call, the whole process blocks.

④ Easier to implement across different OSes.

⑤ Switch fast.

Kernel-level thread:

① Managed by the OS kernel.

② The kernel knows and schedules each thread individually.

③ If one thread blocks, the kernel can schedual others in the process.

④ It depends on OS support.

⑤ Switch slower.
